

Listing of Claims:

This listing of claims will replace all prior versions, and listings, of claims in the application:

1-8. (Canceled)

9. (Original) A method, comprising:

receiving a drive signal associated with a haptic feedback signal; and

applying the drive signal to an electro-mechanical transducer, the electro-mechanical transducer operating in at least one resonant mode from a plurality of resonant modes in response to the drive signal.

10. (Original) The method of claim 9, the electro-mechanical transducer being a first electro-mechanical device, the method further comprising:

applying the drive signal to a second electro-mechanical device different from the first electro-mechanical device, the first electro-mechanical device and the second electro-mechanical device collectively operating in one operational mode from a plurality of operational modes in response to the drive signal for the first electro-mechanical device and the drive signal for the second electro-mechanical device.

11. (Original) The method of claim 9, the electro-mechanical transducer being a first electro-mechanical device, the method further comprising:

applying the drive signal to a second electro-mechanical device different from the first electro-mechanical device, the first electro-mechanical device and the second electro-mechanical device collectively operating in one operational mode from a plurality of operational modes in response to the drive signal for the first electro-mechanical device and the drive signal for the

second electro-mechanical device, the plurality of operational modes including a first operational mode and a second operational mode; and

changing from the first operational mode to the second operational mode, at least one the resonant mode of first electro-mechanical device and the resonant mode of the second electro-mechanical device for the first operational mode differing for the second operational mode.

12. (Original) The method of claim 9, the electro-mechanical transducer being a first electro-mechanical device, further comprising:

applying the drive signal to a second electro-mechanical device different from the first electro-mechanical device, the first electro-mechanical device and the second electro-mechanical device collectively operating in one operational mode from a plurality of operational modes in response to the drive signal for the first electro-mechanical device and the drive signal for the second electro-mechanical device,

the first operational mode being associated with the applying the drive signal to the first electro-mechanical device when the drive signal to the second electro-mechanical device is not applied,

the second operational mode being associated with the applying the drive signal to the second electro-mechanical device when the drive signal to the first electro-mechanical device is not applied.

13. (Original) A method, comprising:

receiving a drive signal; and

applying the drive signal to an electro-mechanical transducer, the electro-mechanical transducer having a plurality of operational modes in response to the drive signal, each

operational mode from the plurality of operational modes having its own combination of at least one resonant mode from a plurality of resonant modes.

14. (Original) The method of claim 13, the electro-mechanical transducer being a first electro-mechanical device, the plurality of operational modes including a first operational mode and a second operational mode, the drive signal being associated with the first operational mode, the method further comprising:

applying the drive signal to a second electro-mechanical device different from the first electro-mechanical device, the second electro-mechanical device and the first electro-mechanical device collectively having the plurality of operational modes.

15. (Original) The method of claim 13, the electro-mechanical transducer being a first electro-mechanical device, the method further comprising:

applying the drive signal to a second electro-mechanical device different from the first electro-mechanical device, the second electro-mechanical device and the first electro-mechanical device collectively having the plurality of operational modes, the plurality of operational modes including a first operational mode and a second operational mode; and

changing from the first operational mode to the second operational mode by altering a characteristic of the drive signal.

16. (Original) The method of claim 13, the plurality of operational modes including a first operational mode and a second operational mode, the drive signal being associated with the first operational mode, the method further comprising:

changing from the first operational mode to the second operational mode by altering a characteristic of the drive signal.

17. (Original) An apparatus, comprising:
 - a signal source, the signal source being configured to output a haptic feedback signal;
 - a driver, the driver being configured to receive the haptic feedback signal and output a drive signal; and
 - an electro-mechanical transducer being configured to receive the drive signal, the electro-mechanical transducer being configured to have a plurality of operational modes, each operational mode from the plurality of operational modes having at least one resonant mode from a plurality of resonant modes.
18. (Original) The apparatus of claim 17, wherein the electro-mechanical transducer is a piezoelectric transducer.
19. (Original) The apparatus of claim 17, wherein the electro-mechanical transducer is an electro-active polymer.
20. (Original) The apparatus of claim 17, the electro-mechanical transducer being a first electro-mechanical device, the apparatus further comprising:
 - a second electro-mechanical device different from the first electro-mechanical device, the second electro-mechanical device being configured to receive the drive signal, the plurality of operational modes being associated with the first electro-mechanical transducer and the second electro-mechanical transducer collectively.
